

Executive Summary

Order Channel Performance & Market Share Analytics — SkyCity Auckland Restaurants & Bars

The supplied dataset contains 1,696 restaurant records and 2,019,134 monthly orders. Delivery channels represent 81.6% of order volume, with Uber Eats alone accounting for 39.6%. Combined Uber Eats + DoorDash dependence is at least 70% for 603 restaurants (35.6%).

Channel	Orders	Share	Net profit
In-Store	371,391	18.4%	\$3,828,417
Uber Eats	800,353	39.6%	\$258,488
DoorDash	436,135	21.6%	\$151,122
Self-Delivery	411,255	20.4%	\$3,628,278

Key findings

- Uber Eats is the largest channel at 39.6% of all orders.
- Self-Delivery represents 20.4% of all orders and has a supplied implied net margin of 22.9%, versus 0.8% for Uber Eats.
- Ghost Kitchens have the highest combined aggregator dependence (70.1%).
- Full-service restaurants have the highest in-store share (25.7%).
- Pizza has the highest self-delivery share (34.3%); Kebabs/Mediterranean has the highest Uber Eats share (48.0%).
- Applying GrowthFactor yields a one-month scenario projection of 2,076,859 orders, a 2.9% increase.

Recommended actions

- Set a channel-risk review for restaurants at $\geq 70\%$ combined Uber Eats + DoorDash dependence.
- Increase first-party ordering and loyalty incentives to shift repeat customers away from aggregators.
- Protect in-store and self-delivery where contribution margins justify investment.
- Create cuisine- and segment-specific channel playbooks instead of one city-wide strategy.
- Collect dated monthly data to enable genuine forecasting, seasonality analysis and performance tracking.

Important data note: channel order counts reconcile exactly to MonthlyOrders. InStoreShare is a total-order share, while UE_share, DD_share and SD_share are delivery-channel shares; they should not be added together.
